

# PERIDOT

Peridot mineral water originates from a limestone mountain, in a Nature Conservation Area, so we bottle it from a protected underground water source. It is a sodium bicarbonate water with mid-range mineral content (1000 mg/l), very alkaline, extremely clean and of stable composition.

Peridot has won several awards at international exhibitions, and buyers voted it 'Product of the Year' in 2013. As we have not advertised in any form, this success is due to the special, unique content, the brand awareness and satisfaction of the buyers.

Peridot water has an alkalinity (ability to neutralize acids) of 8.8 mmol/dm<sup>3</sup>. Medical studies have proved that the consumption of alkaline water helps prevent diseases. The alkalinity helps the total absorption of minerals in the body, making it healthier by achieving and maintaining the acid-alkaline balance.

The deuterium content of Peridot natural mineral water is 139 ppm. It is unique in Europe, the deuterium content of our surface waters is higher (150-160 ppm). Low deuterium content has a beneficial effect on the immune system, and tumor prevention.

Peridot mineral water has been tested by the Hungarian Academy of Sciences. The tests have shown that the water in the Peridot well has made its way into the ground at the end of the Ice Age, therefore it is without any anthropogenic contamination. The tests have also proved that the tritium concentration was below measurement level so the water is younger than 60 years.
